# Pizza Chain README

Piotr Kowalski

September 20, 2013

## 1 Prerequisites

To run this app you must have:

- ruby version 1.9.3-p448 installed (I personally prefer to use rbenv but rvm is also fine).

- sqlite3 (usually available by default on any platform)

## 2 Installation

Get the app from my github account:

```
$ git clone https://github.com/pibako/pizza_chain.git
$ cd pizza_chain
```

and execute `boundle install` command:

```
$ bundle install
```

## 3 Bootstrap

First setup database

```
$ bundle exec rake db:setup
```

Then test it:

```
$ bundle exec rake
```

I usually use guard for continuous testing:

```
$ bundle exec guard -i
```

All tests should be green now.

# 4    Usage

Start server locally:

```
$ rails s
```

and go to `http://localhost:3000`

## 4.1    Public area:

You should see list of pizzerias with links to see more details about each. At the top of the page you can find link to admin area.

## 4.2    Admin area:

Admin pages are delivered using ActiveAdmin (to write my own administration framework I consider a waste of time). Go to `http://localhost:3000/admin` and login with the following credentials:

- email: `pizza@chain.com`

- password: `pizzachain`

You can easily manage restaurants and pizzas.
